ⓘ INFORMATION

The power consumption parameter is optional. If some parameter is not be activated in the system, the parameter will show "--"
The heat pump capacity is for reference only, not used to judge the ability of the unit. The accuracy of sensor is ±1℃. The flow rates parameters are calculated according to the pump running parameters,the deviation is different at different flow rates,the maximum of deviation is 15%.The flow parameters are calculated according to the electrical parameters of the pump operation. The operating voltage is different and the deviation is different. The display value is 0 when the voltage is less than 198V.

6.10 Network Configuration Guidelines

- The wired controller realizes intelligent control with a built-in module, which receives control signal from the APP.
- Before connecting the WLAN, please check for it if the router in your environment is active and make sure that the wired controller is well-connected to the wireless signal.
- During the Wireless distribution process, the LCD icon " 📶 " flashes to indicate that the network is being deployed. After the process is completed, the icon " 📶 " will be constantly on.

6.10.1 Wired Controller Setting

The wired controller settings include AP MODE and RESTORE WLAN SETTING.
